# Birthday Cake Candles

by [shashank21j](#)

Problem

[Submissions](#)[Leaderboard](#)[Discussions](#)[Editorial](#)

Colleen is turning  $n$  years old! Therefore, she has  $n$  candles of various heights on her cake, and candle  $i$  has height  $height_i$ . Because the taller candles tower over the shorter ones, Colleen can only blow out the tallest candles.

Given the  $height_i$  for each individual candle, find and print the number of candles she can successfully blow out.

## Input Format

The first line contains a single integer,  $n$ , denoting the number of candles on the cake.

The second line contains  $n$  space-separated integers, where each integer  $i$  describes the height of candle  $i$ .

## Constraints

- $1 \leq n \leq 10^5$
- $1 \leq height_i \leq 10^7$

## Output Format

Print the number of candles Colleen blows out on a new line.

## Sample Input 0

```
4
3 2 1 3
```

## Sample Output 0

```
2
```

## Explanation 0

We have one candle of height **1**, one candle of height **2**, and two candles of height **3**. Colleen only blows out the tallest candles, meaning the candles where  $height = 3$ . Because there are **2** such candles, we print **2** on a new line.
